1. Calcular la matriz de rigidez de la placa de espesor  $t$  sujeta a esfuerzo plano, usando un elemento en coordenadas naturales

### Solución 1

La matriz de rigidez es

$$K = \int_{-1}^1 \int_{-1}^1 B^T C B \det J t ds dr$$

La matriz constitutiva es

$$C = \frac{E}{1 - \nu^2} \begin{bmatrix} 1 & \nu & 0 \\ \nu & 1 & 0 \\ 0 & 0 & \frac{1-\nu}{2} \end{bmatrix}$$

Funciones de forma unidimensional de dos nodos

$$N(r) = \left[ \frac{1}{2} - \frac{1}{2}r \quad \frac{1}{2} + \frac{1}{2}r \right]$$

$$N(s) = \left[ \frac{1}{2} - \frac{1}{2}s \quad \frac{1}{2} + \frac{1}{2}s \right]$$

Multiplicando

$$\begin{bmatrix} \frac{1}{2} - \frac{1}{2}r \\ \frac{1}{2} + \frac{1}{2}r \end{bmatrix} \begin{bmatrix} \frac{1}{2} - \frac{1}{2}s & \frac{1}{2} + \frac{1}{2}s \end{bmatrix} = \begin{bmatrix} \frac{1}{4}(r-1)(s-1) & -\frac{1}{4}(r-1)(s+1) \\ -\frac{1}{4}(r+1)(s-1) & \frac{1}{4}(r+1)(s+1) \end{bmatrix} \\ = \begin{bmatrix} N_1 & N_4 \\ N_2 & N_3 \end{bmatrix}$$

Escribiendo en la forma estándar

$$N^T = \begin{bmatrix} \frac{1}{4}(r-1)(s-1) \\ -\frac{1}{4}(r+1)(s-1) \\ \frac{1}{4}(r+1)(s+1) \\ -\frac{1}{4}(r-1)(s+1) \end{bmatrix} = \begin{bmatrix} N_1 \\ N_2 \\ N_3 \\ N_4 \end{bmatrix}$$

Colocando un sistema de referencia

Coordenadas de los nodos

$$[x_1, y_1] = [0, 0] \quad [x_3, y_3] = [a, b]$$

$$[x_2, y_2] = [a, 0] \quad [x_4, y_4] = [0, b]$$

Funciones que interpolan la geometría

$$x = N_1 x_1 + N_2 x_2 + N_3 x_3 + N_4 x_4$$

$$y = N_1 y_1 + N_2 y_2 + N_3 y_3 + N_4 y_4$$

Reemplazando las coordenadas de los nodos

$$x = \frac{a}{2}(r+1)$$

$$y = \frac{b}{2}(s+1)$$

El jacobiano y el jacobiano inverso son

$$J = \begin{bmatrix} \frac{\partial x}{\partial r} & \frac{\partial y}{\partial r} \\ \frac{\partial x}{\partial s} & \frac{\partial y}{\partial s} \end{bmatrix} \quad J^{-1} = \begin{bmatrix} \frac{\partial r}{\partial x} & \frac{\partial s}{\partial x} \\ \frac{\partial r}{\partial y} & \frac{\partial s}{\partial y} \end{bmatrix}$$

Reemplazando derivadas

$$J = \begin{bmatrix} \frac{a}{2} & 0 \\ 0 & \frac{b}{2} \end{bmatrix} \quad J^{-1} = \begin{bmatrix} \frac{2}{a} & 0 \\ 0 & \frac{2}{b} \end{bmatrix}$$

Determinante del jacobiano

$$\det J = \frac{ab}{4}$$

La matriz de deformaciones es

$$B = \begin{bmatrix} \frac{\partial N_1}{\partial x} & 0 & \frac{\partial N_2}{\partial x} & 0 & \frac{\partial N_3}{\partial x} & 0 & \frac{\partial N_4}{\partial x} & 0 \\ 0 & \frac{\partial N_1}{\partial y} & 0 & \frac{\partial N_2}{\partial y} & 0 & \frac{\partial N_3}{\partial y} & 0 & \frac{\partial N_4}{\partial y} \\ \frac{\partial N_1}{\partial y} & \frac{\partial N_1}{\partial x} & \frac{\partial N_2}{\partial y} & \frac{\partial N_2}{\partial x} & \frac{\partial N_3}{\partial y} & \frac{\partial N_3}{\partial x} & \frac{\partial N_4}{\partial y} & \frac{\partial N_4}{\partial x} \end{bmatrix}$$

Debido a que las funciones de forma están en función de  $r$  y  $s$ , se usará la regla de la cadena

$$\frac{\partial N_i}{\partial x} = \frac{\partial N_i}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_i}{\partial s} \frac{\partial s}{\partial x}$$

$$\frac{\partial N_i}{\partial y} = \frac{\partial N_i}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_i}{\partial s} \frac{\partial s}{\partial y}$$

Reemplazando en  $B_i$

$$B_1 = \begin{bmatrix} \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial x} & 0 & \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial y} \\ 0 & \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial y} & \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_1}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_1}{\partial s} \frac{\partial s}{\partial y} \end{bmatrix} = \begin{bmatrix} \frac{s-1}{2a} & 0 \\ 0 & \frac{r-1}{2b} \\ \frac{r-1}{2b} & \frac{s-1}{2a} \end{bmatrix}$$

$$B_2 = \begin{bmatrix} \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial x} & 0 & \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial y} \\ 0 & \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial y} & \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_2}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_2}{\partial s} \frac{\partial s}{\partial y} \end{bmatrix} = \begin{bmatrix} -\frac{s-1}{2a} & 0 \\ 0 & -\frac{r+1}{2b} \\ -\frac{r+1}{2b} & -\frac{s-1}{2a} \end{bmatrix}$$

$$B_3 = \begin{bmatrix} \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial x} & 0 & \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial y} \\ 0 & \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial y} & \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_3}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_3}{\partial s} \frac{\partial s}{\partial y} \end{bmatrix} = \begin{bmatrix} \frac{s+1}{2a} & 0 \\ 0 & \frac{r+1}{2b} \\ \frac{r+1}{2b} & \frac{s+1}{2a} \end{bmatrix}$$

$$B_4 = \begin{bmatrix} \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial x} & 0 & \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial y} \\ 0 & \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial y} & \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial N_4}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial N_4}{\partial s} \frac{\partial s}{\partial y} \end{bmatrix} = \begin{bmatrix} -\frac{s+1}{2a} & 0 \\ 0 & -\frac{r-1}{2b} \\ -\frac{r-1}{2b} & -\frac{s+1}{2a} \end{bmatrix}$$

### Solución

Ecuación diferencial de la viga

$$EI \frac{d^4 v}{dx^4} + q(x) = 0$$

La aproximación de los desplazamientos será

$$v(x) = \phi(x)$$

La función ponderada será

$$W = \phi_i(x)$$

Aplicando el método de Galerkin

$$\int_0^L \left( EI \frac{d^4 \phi}{dx^4} + q \right) \phi_i dx = \int_0^L \phi_i EI \frac{d^4 \phi}{dx^4} dx + \int_0^L \phi_i q dx = 0$$

Usando el teorema de Gauss o integrando por partes

$$\left( \phi_i EI \frac{d^3 \phi}{dx^3} - \frac{d\phi_i}{dx} EI \frac{d^2 \phi}{dx^2} \right) \Big|_0^L + \int_0^L \frac{d^2 \phi_i}{dx^2} EI \frac{d^2 \phi}{dx^2} dx + \int_0^L \phi_i q dx = 0$$

Cortante y momento

$$V = EI \frac{d^3 \phi}{dx^3}$$

$$M = EI \frac{d^2 \phi}{dx^2}$$

Reemplazando

$$\left( \phi_i V - \frac{d\phi_i}{dx} M \right) \Big|_0^L + EI \int_0^L \frac{d^2 \phi_i}{dx^2} \frac{d^2 \phi}{dx^2} dx + \int_0^L \phi_i q dx = 0$$

Reordenando

$$EI \int_0^L \frac{d^2 \phi_i}{dx^2} \frac{d^2 \phi}{dx^2} dx = - \int_0^L \phi_i q dx - \left( \phi_i V - \frac{d\phi_i}{dx} M \right) \Big|_0^L$$

La matriz de rigidez es

$$K = EI \int_0^L \frac{d^2 \phi_i}{dx^2} \frac{d^2 \phi}{dx^2} dx$$

- Resolver la estructura con  $E$ ,  $I$ ,  $A$  constantes por el método de Rayleigh-Ritz
